EIGHTY- EIGHT OIL TO BUILD FIRST MAJOR MULTI- GRADE CRUDE OIL LOADING UNIT TRAIN TERMINAL NEAR GUERNSEY, WYOMING

Casper, Wyoming – January 29, 2013 - Eighty-Eight Oil LLC (“EEOLLC”) announced today its plans to construct and operate a unit train facility on BNSF’s mainline near the Guernsey crude oil pipeline hub. The facility will be directly connected to EEOLLC’s existing Guernsey crude oil terminal which has two million barrels of storage and currently receives crude oil from Butte Pipeline, Belle Fourche Pipeline, Platte Pipeline, and the Rocky Mountain Pipeline System. The Guernsey terminal also maintains truck unloading facilities. The facility will be the first rail transloading terminal capable of loading multiple crude types including those from the Williston Basin (e.g. Bakken), the Powder River Basin (e.g. Niobrara), Southwest Wyoming, Big Horn Basin and Canada. “Because this terminal is being designed to handle multiple crude types, we are confident of its long term viability”, says Jerry Herz, Superintendent of EEOLLC.

“Further, by connecting our terminal to BNSF’s expansive railway system, we can provide producers of the Rocky Mountains and Canada further flexibility in adding value to their production and transporting it to markets throughout the United States.”

“We look forward to working with EEOLLC to build and serve this unique unit train rail facility,” said Dave Garin, BNSF group vice president, industrial products. “As demand continues to rise, rail has stepped up to provide a more flexible, long-term, and economical option to ship crude oil to destination markets throughout the East, West and Gulf coasts and along the Mississippi River.”

With completion expected later this year, the facility will initially include three rail loop tracks and required tankage for unit train loading operations. Each loop track will be capable of holding one unit train; in addition, the automated loading racks will be capable of loading two trains with different crude types simultaneously. Initial rail loading capacity will be approximately 80,000 barrels per day with expansion capability.

About Eighty-Eight Oil LLC: Eighty-Eight Oil LLC, established in 1963, is a privately held crude oil marketing and logistics company within True companies of Casper, WY. EEOLLC markets crude oil from the Rocky Mountain region throughout the United States. The True companies are privately owned and operated companies with operations throughout the United States.
